Nutritional choices can impact babies’ comfort. Infant formulas containing INFAT® have been clinically shown to improve gut comfort and promote softer stools, reduce crying, and increase total hours of night sleep, compared with control infant formulas. Overall, INFAT® improve the wellbeing of formula-fed infants and their parents.

**Gut Comfort**

INFAT® has been shown to help formula-fed babies acquire similar levels of beneficial gut bacteria as breastfed babies, increasing their intestinal comfort. Babies need healthy gut bacteria to promote healthy digestion and immune system. Breastfed babies get their protection naturally through their mothers’ milk, but formula-fed babies need to acquire it through careful and proper nutrition. Infant formulas containing INFAT® have been clinically proven to contribute to the growth of healthy gut bacteria, leading to a more comfortable baby.

**Softers Stools**

INFAT® promotes proper digestion, leading to softer stools, increasing babies’ comfort. Healthy breast-fed babies’ stools are typically frequent, with a very runny consistency. However, babies fed with standard formula usually have less frequent and more solid stools leading to discomfort and even constipation. Clinical studies suggest that infant formulas containing INFAT® have a beneficial effect on stool consistency compared with standard formulas, reducing constipation by as much as 50%.

**Less Crying**

INFAT® is the only fat ingredient that has been clinically shown to reduce crying time in healthy babies. In clinical studies around the world, infant formulas containing INFAT® have proved to be better absorbed in infants’ intestine than standard formulas, resulting in softer stools and increased comfort – leading to overall less crying during the day. INFAT® is the only fat ingredient for infant formulas that has been clinically shown to reduce crying time in healthy babies by up to 75% during the first weeks of their lives.

**Night Sleep**

Babies fed with INFAT®-containing formula sleep more hours during the night. Healthy, comfortable babies sleep better and more than babies who are less comfortable. INFAT® fed babies had a long sleep duration compared to the control formula fed babies. A study showed that at 12-weeks of age, babies fed with infant formula containing INFAT® slept more than half an hour longer than babies fed with control formulas.
Super-comfort
for a happy baby

Super Comfort by INFAT® assures mothers they are nourishing their babies with the right ingredients for maximum comfort.
